problem... Functional equations are equations where the unknowns are functions, rather than a traditional variable. However, the methods used to solve functional equations can be quite different than the methods for isolating a traditional variable. Each functional equation provides some information about a function or about multiple functions. The main assertions of the theory of linear abstract functional differential equations are based on the theorems about linear equations in Banach spaces. We give here without proofs certain results of the book of Krein which we will need below. We formulate some of these assertions not in the most general form, but in the form satisfying our aims. Introduction Roughly speaking, a functional differential equation, or FDE, is a differential equation for which $x'(t)$ depends not only on $x(t)$ but also on the “past history” of the function $s \rightarrow x(s)$ for $s \leq t$. A precise formulation will be given later. Deceptively simple-looking examples are provided
