The periodic table, also known as the periodic table of elements, is a tabular display of the chemical elements, which are arranged by atomic number, electron configuration, and recurring chemical properties. The structure of the table shows periodic

trends. Periodic table - Wikipedia Seeing chemical elements arranged in the modern periodic table is as familiar as seeing a map of the world, but it was not always so obvious. The creator of the periodic table, Dmitri Mendeleev, in 1869 began collecting and sorting known properties of elements, like he was playing a game, while traveling by train. Periodic Table of Elements - PubChem The bottom two rows of elements actually fit into the periodic table, but were placed below the table to create more room. The first row at the bottom fits between elements 57 and 72. These are called the “lanthanides” after element 57, which is lanthanum. The second row at the bottom fits between elements 89 and 104.
